

How to propagate a succulent

Step 1.

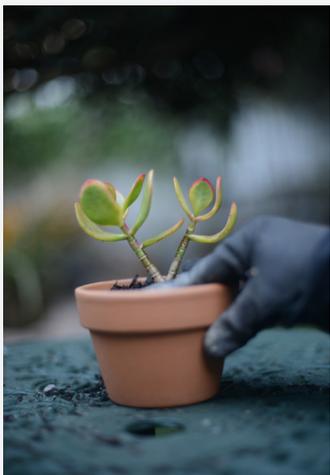

Take a clipping from an existing succulent. The Pope Comfort Cut Bypass Pruners will ensure you get a clean cut. Lay the clippings out of the weather to dry for a few days.

Step 2.

Place the clipping in a jar of water with the root submerged. Position the jar in a sheltered location until you see roots start to form.

Step 3.

Once the roots have grown 1-2cm, your succulent is ready to pot. Use a good quality well draining potting mix. Make sure the leaves sit above the potting mix to prevent rotting.

Step 4.

If your succulent is indoors, place it in a sunny position and water it every 2-4 weeks. If it is outside, rainwater is usually enough!
